# PROBLEM SET 2

2.1 - HTML and DOM:

a) Dom representation :

b) Dom representation :
first child is thead
last child is tbody
parent node is body
previous sibling is h1
next sibling nothing

To navigate from the table node to the link node located in the head, one would first access the parent node of the table node which is the body node, then access the parent node of the body node which is the html node, and then access the first child node of the html node which is the head node, and finally access the first child node of the head node which is the link node.

2.2 - STYLER:
